ABOUT ME

I'm a DevOps engineer with just over 3 years of experience working on cloud infrastructure, Kubernetes, and observability. Most of my work has been on AWS and Azure, though I've picked up GCP along the way too.

I enjoy the reliability side of things — building proper monitoring, tightening up deployment pipelines, and making sure systems don't fall over at 2am. Lately I've been deep into the Grafana ecosystem (Loki, Tempo, Mimir, Pyroscope) and internal platform tooling. I work best in teams that care about doing things properly — good automation, solid observability, and deployments you can actually trust.

KEY COMPETENCIES

- **Cloud Platforms:** AWS (EKS, EC2, VPC, IAM, S3, CloudFormation), Azure, GCP
- **Containers & Orchestration:** Kubernetes, Docker, Helm, FluxCD, GitOps
- **CI/CD & Infrastructure as code:** GitHub Actions, Terraform, CloudFormation
- **Observability:** Prometheus, Grafana, Loki, Tempo, Mimir, Pyroscope, Thanos, Grafana Alloy
- **Scripting & OS:** Bash, Python, PowerShell, Linux, Git
- **Platform & Tooling:** Backstage, Kong Ingress, GitHub Copilot, Cursor

PROFESSIONAL EXPERIENCE

IGT1 Lanka (Sitecore)

DevOps Engineer

Feb 2025 - Feb 2026

- **Global Release Engineering:** Worked on getting our deployment pipelines consistent across all our global Kubernetes clusters. We were using Helm and FluxCD to manage everything, and a big part of my job was making sure a release in one region behaved the same way in every other region. Cut down a lot of the manual steps that were slowing releases down.
- **Pyroscope Implementation:** Took ownership of getting Pyroscope set up for continuous profiling across our services. This involved setting up the Kong Ingress layer for authentication and building out the Grafana Alloy pipelines to handle the data flow. It wasn't a straightforward integration but once it was running, the team finally had proper visibility into CPU and memory usage in prod.
- **AI-Enhanced Profiling:** Integrated the Grafana LLM plugin with Pyroscope so the team could get AI-generated analysis on flame graphs. Reading flame graphs manually is slow and easy to get wrong — this gave on-call engineers a starting point for root cause analysis that cut down investigation time noticeably.
- **Internal Platform Engineering (Project UNITE):** Was part of the team building UNITE, an internal platform that orchestrates our full deployment workflow through Backstage. I specifically built the service verification feature — it runs automated health checks after every deployment to confirm the service is actually working before the release is marked complete. Stopped a few bad releases from going unnoticed.
- **Operational Support:** Handled day-to-day operational support across the infrastructure — managing alerting rules in Prometheus and Thanos, jumping on real-time incidents, and fixing broken GitHub Actions workflows when they came up. We stayed at 99.9% uptime across the board, which required being on top of things constantly..
- **Technical Documentation:** Wrote and maintained runbooks and SOPs for the observability stack. With teams spread across different time zones, having clear documentation made a real difference when incidents happened and the person who set something up wasn't available.

- **DevOps & Cloud Curriculum:** Built and ran a DevOps and cloud training programme covering Docker, Kubernetes, CI/CD, and deploying to cloud platforms. I set up actual lab environments so students could practice on real pipelines, not just theory. The goal was to get people to a point where they could contribute to a real engineering team.
- **Engineering Mentorship:** Mentored developers through full-stack projects using the MERN stack, with a focus on code quality, Git workflows, and working in an Agile team. Tried to teach the stuff university doesn't — how to structure a PR, how to handle a production bug, that kind of thing.

CodeRunner**Associate DevOps Engineer**

December 2022 - December 2023

Started my DevOps career by managing the core infrastructure and security foundations for internal development environments.

- **Infrastructure Handling:** Managed the AWS infrastructure for our internal environments — VPCs, subnets, security groups, and IAM roles. I was pretty strict about least privilege and ran regular audits to make sure nothing had drifted from what it should be. Good foundation for understanding how AWS actually works under the hood.
- **Server Maintenance:** Handled daily Linux administration for our dev and staging servers. Wrote Bash scripts to automate patching and log rotation so we weren't doing it manually every time. Kept things stable and gave me a solid grounding in how servers behave in practice.

EDUCATION & CERTIFICATIONS**Bachelor of Science in Computer Science**

University: University Of Jaffna
Sri Lanka

AWS Certified Solutions Architect – Associate (in progress)

expected Q3 2026

Certified Kubernetes Administrator – CKA (planned)

Q4 2026

VOLUNTEERING**YGC Innovation Festival 2024**

Panel Judge - School student competition

YGC Innovation Festival 2025

Panel Judge - School student competition

TechMentor

Mentoring school students on IT

Uki 2024, 2025

Panel judge - Website Development Course

Special Session - University of Vavuniya 2025

Done AWS session for the students who following ICT degree

President 2022 - 2023

Gavel Club, University Of Jaffna

Designer 2022 - 2023

IEEE - Google Hash Code (UOJ)
